

Paediatric Urology

Paediatric Urology is a surgical subspecialty focused on the evaluation and treatment of congenital and acquired disorders of the genitourinary tract in infants, children, and adolescents

Paediatric urologists care for foetuses that have urologic abnormalities diagnosed on prenatal ultrasound and frequently care for prepubescent females with genital issues. While most paediatric urology patients are younger than 18 years of age, adults with congenital urologic abnormalities and/or reconstructive issues are also cared for by paediatric urologists.

Comprehensive paediatric urological care, and the highest quality surgical services for all genitourinary conditions in children,

- * hydroceles,
- * hernias,
